                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Unjectivent of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This clone was derived from human PAC library RPCI-4, prepared by Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from
                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                    entire insert of this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RPI-42M2. Actual start of this
clone is at base position 1 of RP4-810E6; actual end is at 152927
                                                                                                                                                                                                                                                                                                   NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The

It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequencing vector: M13,71%

NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in length of unknown length of 217022: contig of 31327 bp in length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        * NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                       Center: Washington University Genome Sequencing Center
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 length

NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 5 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Insert size: 188000; agarose-fp

It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA ON Nov 15, 2002 this sequence version replaced gi:23195556.

The sequence in this assembly is a combination of BAC based reads and whole genome shorgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/racifold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the aetimated size. The sequence may extend beyong the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                        Direct Submission

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        216639: contig of 216639 bp in length 216739: gap of unknown length 224628: contig of 7889 bp in length 224728: gap of unknown length 234582: contig of 9854 bp in length 235702: contig of 1020 bp in length 235702: contig of 1020 bp in length 235802: gap of unknown length 235802: gap of unknown length 235802: gap of unknown length

Baylor Plaza, Houston, TX 77030, USB

On Nov 9, 2002 this sequence version replaced gi:23267991.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold') within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a "working draft" sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the flinished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                              Worley, K.C.

This invention relates to the DNA and protein sequences of novel isolated human proteases (PRTS). the protein sequences of the invention are useful for the screening a compound for effectiveness as an agonist or antagonist of its activity, the identified agonist and antagonist are useful for treating a disease or condition associated with decreased or consistence or the preparing polyclonal or monoclonal antibodies useful as an immunogen for preparing polyclonal or monoclonal antibodies by hybridoma technology. An antibody that binds the PRTS protein is so useful for detection and purification of the proteins and can be used to diagnose a condition or disease associated with expression of PRTS in a subject or in a biological sample. The sequences of the invention are useful for diagnosis, treatment and prevention of gastrointestinal disorders such as gastritis, ulcerative colitis, Reye's syndrome, etc; cardiovascular such as atherosclerosis, hypertension, myocardial

The present sequence is the coding sequence for human ubiquitin protease coding sequence and protein are useful as 23431. The ubiquitin protease coding sequence and protein are useful as casgars or targets in assays for treatment and diagnosis of ubiquitin-complete or related disorders, especially disorders mediated by ubiquitin-complete or related disorders, especially disorders mediated by the uncomplete or deubiquitinating enzymes. The protein and coding sequence are also useful conformating absorbers involving the following: the spleen e.g. Generalists and typhoid fever, the lung such as bronchial asthma, the colon e.g. a diarrhoea and dysentery, the liver e.g. jaundice and cholestasis, the uterus and endometrium e.g. endometritis, the brain e.g. color e.g. acute meningitis and Alzheimer disease, T-cells including transplant rejection and autoimmune disease, such as systemic lupus erythematosus, diseases of the skin such as malignant melanoma, the bone marrow e.g. Brotering and T-lymphoid leukaemias, the hidner e.g. Hodgkin disease, B-cells e.g. cells e.g. anaemia, the thymus e.g. Hodgkin disease, B-cells e.g. proplements including periductal mastitis, the testis and epididymis e.g. hyperthyroidism, the skelatal muscle e.g. rhabdomyosarcoma, the pancreas cells e.g. ectopic pancreas, reduced platelet number e.g. HIV (human immunodeficiency virus)-associated thrombocytopaenia and disorders involvame and alasmas including precursor T lymphoblastic lairs and alasmas including precursor T lymphoblastic

Rudolph-Owen LA; Meyers RE, Glucksmann MA, Kapeller-Libermann R, 2003-342047/32. P-PSDB; ABU08951 New nucleic acid or polypeptide, useful for preparing a composition for diagnosing or treating diseases e.g., tumor.

Claim 2; Fig 1; 281pp; English

The invention relates to a new isolated nucleic acid molecule encoding cone of 6 polypeptides (ubiquitin protease, lipase, Dynamin, short chain dehydrogenase, Abaw-TS (a disintegrin and metalloprocease domain protein clebydrogenase, Abaw-TS (a disintegrin and metalloprocease domain protein with thrombospondin (TS) domains) and gamma butyrobetaine-hydroxylase (Gamma BHB). Also included are the polypeptide, host cells containing the mucleic acids, an antibody that selectively binds to the polypeptide, a method for containing the method for producing the polypeptide, a method for identifying a compound that modulates the activity of the polypeptide, a method for identifying a compound that modulates the activity of the polypeptide and a method for identifying a compound that modulates the activity of the polypeptide and a method for identifying a compound that modulates the activity of the polypeptide is useful for preparing a composition for diagnosing or compound that modulates the activity of the polypeptide and a method for identifying a compound that modulates the activity of the polypeptide and a method for identifying a compound that modulates the activity of the polypeptide. The nucleic acid is a composition for diagnosing or compound that modulates the activity of the polypeptide and a method for identifying a composition for diagnosing or compound action bronchitis and emphysem), colon disorders (e.g. adult respiratory discase and Crobnic liver disease, attaxia and multiple sclerosis, T-cell disorders (e.g. actions), heart disorders (e.g. ischaemic heart disease, attaxia and multiple sclerosis), T-cell disorders (e.g. ischaemic heart disease, and lupus erythemateus), heart disorders (e.g. ischaemic heart disease, and lucaters (e.g. lucationy pathy), kindry disorders (e.g. DiGeorge syndrome), B-cell disorders (e.g. lucation), and intention and cardiomypeathy of breast disorders (e.g. mastitis), testicular disorders (e.g. mastitis), testicular and diseases and disorders (e.g. encompound control active diso

The present invention describes primer sets for synthesising 5602 full-

(a) an oligo-dr primer and an oligonaclectide complementary to the

complementary strand of a polynucleotide which comprises one of the 5602

complementary strand of a polynucleotide which comprises one of the 5602

complementary strand of a polynucleotide which comprises one of the 5602

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises a 5'-end

complementary strand of a polynucleotide of comprises and the compination of 6 particularly full-length cDNAS. The primers are also useful for the 6 detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAS. The primers allow obtaining of the full-length CDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers allow obtaining of the full-length cDNAS. The primers and AAH3638 to AAH3632 represent thuman amino acid sequences; and AAH3629 to AAH3632 repre

The invention relates to an isolated polymucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful for identifying expressed genes or for physical mapping of human genome encoded polymeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical

New polynucleotides comprising sequences assembled from expressed sequence tags (EGTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet or coagulation disorders.

Claim 1; SEQ ID NO 390; 1012pp + Sequence Listing; English.

```
ABL19691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB06037 to ABB06164. The novel sequences (NS) can have cytosetatic, osteopathic, gynaecological, neuroprotective, antiarthritic, antiposniatic, ophthalmological, virucide, vasotropic, antiarthritic, antiposniatic, ophthalmological, virucide, vasotropic, antiarthritic, antiinflammatory, dermatological, conserved anorectic, muscular, anti-HIV, antiinflammatory, dermatological, anticoagulant, antifibrinolytic, hypotension, antiasthmatic, cardiovascular, anticoagulant, antifibrinolytic, hypotension, antiasthmatic, cardiovascular, anticoagulant, anticonvolsant, activities. The NS can be used in vaccines, coortropic and contraceptive activities. The NS can be used in vaccines, contropic and contraceptive activities. The NS can be used in vaccines, contropic and contraceptive activities. The NS can be used in vaccines, contropic and antisense therapy. Nucleic acids, expression vectors and diagnosing e.g. cancer, osteoporosis, endometriosis, degenerative diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, cataracts, restonosis, atherosclerosis, inflammation, skin disorders disease, coagulation disease, ischaemia, hypertension, asthma, immune coageneration, dispetes, anxiety, debremer's disease and as a contraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TITIATATCAGGICCCATGATGICAAAAATGGAGGIGAACTTACTCCACCCACCCATAGC 1353

(I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased cypression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cuplediate acids into a host cell and culturing the cell to express the protein and polynucleotides may be used to produce the secreted (I), by inserting the conclining and polynucleotides may be used to prevent, concern and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87699 cancers and cannon immune/haematopoietic-derived cells. AAK64703 sequences from the present invention. AAK64912 to AAK64950 and AAMGATON.

AAX AAX54951 to AAX64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cativity, and can be used in gene therapy and vaccine production. (I) cytoteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the colynucleotides may be used to produce the secreted (I), by inserting the mucleic acids into a host cell and culturing the cell to express the colories and cancer metastases of haematopoietic-derived cells. AAK64703 concers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK64942 to AAK87694 represent human immune/haematopoietic antigen genomic represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure, SEQ ID NO 24822; 3071pp + Sequence Listing; English.

Ambaryal to Ambaryal and entrouse the number number nature antigen (1) and oatd sequences given in AAM8170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) by proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased treatment of diseases associated with inappropriate (I) expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the correct and canter and polymucleotides may be used to prevent, concerns and canter materiases of haematopoietic-related diseases, especially cancer metastisses of haematopoietic artised cells. AAK64703 cto AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention AAK49492 to AAK54950 and AAM82169 cepters represent invention. ö 9513 9573 1636 9633 1696 AAGATGAGGAGGCCACTCCGCACGAGCTTCAAGAACCCATGACCCTAAAACGGTGCTAATA 10053 1756 9753 9813 AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) ATAGTAATTCTTTGGAGAACCCTACCAAGCCCGTTCCCTCTTCTACCATTACCAATTCTG 9454 AGAATCCACCTCACTTAAATGGGACTGGACCATTGAAAGACACGCCAAGCAGTTCCATGT CGAGTCCTAACGGGAATTCCAGTGTCAACAGGGCTAGTCCTGTTAATGCTTCAGCTTCTG TCCAAAACTGGTCAGTTAATAGGTCCTCAGTGATCCCAGAACATCCTAAGAAACAAAAA CAGTACAGTCTACCTCGAACGCATCTACGATGTCAGTTTCTAGTAAAGTAACAAAACCGA 1457 AGAATCCACCTCACTTAAATGGGACTGGACCATTGAAAGACACGCCAAGCAGTTCCATGT CGAGTCCTAACGGGAATTCCAGTGTCAACAGGGCTAGTCCTGTTAATGCTTCAGCTTCTG TTACAATCAGTATTCACAACAAGTTGCCTGTTCGCCAGTGTCAGTCTCAACCTAACCTTC ATAGTAATTCTTTGGAGAACCCTACCAAGCCCGTTCCCTCTTCTACCATTACCAATTCTG CAGTACAGTCTACCTCGAACGCATCTACGATGTCAGTTTCTAGTAAAGTAACAGAAACCGA TCCCCCGCAGTGAATCCTGCTCCCAGCCCGTGATGAATGGCAAATCCAAGCTGAACTCCA GCGTGCTGGTGCCCTATGGCGCCCGAGTCCTCTGAGGACTCTGACGAGGAGTCAAAGGGGG GCGTGCTGGTGCCCTATGGCGCCGAGTCCTCTGAGGACTCTGACGAGGAGTCAAAGGGGC TGGGCAAGGAGAATGGGATTGGTACGATTGTGAGCTCCCCACTCTCCCGGCCAAGATGCCG AAGATGAGGAGGCCACTCCGCACGAGCTTCAAGAACCCATGACCCTAAAACGCTGCTAAATA GTGCAGACAGCGACAGTGACCCGAAAGAAAAAGGCCCTAGCGCCTGATGGTGCCCAGCTGCC Gaps Sequence 21436 BP; 5267 A; 4950 C; 5418 G; 5801 T; 0 U; 0 Other; 0; DB 4; Length 21436; 0; Indels 29.9%; Score 722; DE 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic

cativity, and can be used in gene therapy and vaccine production. (I)

proteins and polynucleotides may be used in the prevention, diagnosis and

treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased

expression by rectifying mutations or deletions in a patient's genome

that affect the activity of (I) by expressing inactive proteins or to

supplement the patients own production of (I). Additionally, (I)

culturaliseotides may be used to produce the secreted (I), by inserting the

nucleic acids into a host cell and culturing the cell to express the

protein. (I) proteins and polynucleotides may be used to prevent,

cancers and cancer metastases of haematopoietic-related diseases, especially

cancers and cancer metastases.

WPI; 2001-465566/50. P-PSDB; AAU23207.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.

Claim 4; SEQ ID NO 303; 1180pp; English.

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU2814), and the CDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketomuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and
